- **Clean off any dirt or debris after each use** - A pressure washer that is clogged with dirt or debris can cause serious damage to both the motor and pump. To prevent this from happening, always ensure to clean off any debris before and after each use. This can be done easily with a cloth or soft bristle brush.
- **Change the oil regularly** - Pressure washers need regular oil changes to keep their motors running smoothly and efficiently. Check your owner's manual for how often you should be doing this and what type of oil you need for your specific model of pressure washer. Regularly changing the oil helps remove old contaminants from the engine and prevents excessive wear on internal components.
- **Inspect hoses frequently** - Pressure washers come with two hoses - one high-pressure hose from the unit to the nozzle, and a lower-pressure hose from the unit to a water source such as a garden hose or faucet. Inspect these hoses frequently for cracks or leaks which can affect performance and cause significant damage if left unchecked. Check hose connections regularly in case they need tightening or replacing as well.
- **Use proper cleaning techniques** - Proper cleaning techniques are an essential part of keeping your pressure washer running smoothly. Make sure you use the proper nozzle tip when cleaning different surfaces so that you don't apply too much pressure in one area; this could potentially damage the surface being cleaned as well as the machine itself.
